NET Framework. It includes the powerful ASP.NET 2.0, WCF, ADO.NET and other .NET Framework services. Adobe Acrobat 9 Professional PC, Mac, and mobile document authoring solutions bring together PDF creation, print, and online distribution to deliver high-fidelity content for all channels. Take control of your documents, and be more agile to meet the needs of today's digital channels. After using the library to study sequences, they decided they needed to improve their sequencing system. So they decided to create a large compaction. The new sequence was a series of experiments and was called ACT. Act could assemble a sequence from two or more gene strands, something one can never do with the older approach. To create the ACT library, the researchers first sequenced many small pieces of DNA. They used a gene in E. coli that contains six genes, or pieces, each gene consisting of 100 letters. The scientists then used an automated machine that cut the DNA into these small pieces. These pieces were then pasted together and then either sequenced again or compared to a finished gene. A 10 megabase gene string was created in about 30 hours. Some of the genes in the ACT library were designed to improve the library and others to be used to improve sequencing and assembly. In this second, completely redesigned library, they used the DNA information to direct the computer to add the right nucleotides to form a gene. Initial results indicate that the ACT library is 5,000 times smaller than its predecessor, the 7 megabase "Yeast Acute" library, and can be assembled by the automated machine 10,000 times faster. As a comparison, the researchers used ACT and ASF to create a genome sequence of the bacterium Haemophilus influenzae. H. influenzae is the most common cause of sinusitis and ear infections. As of January 2006, the ACT library contains a total of 8.3 million fragments.
